

**Problem 4:** The weight of **N** items and their corresponding values are given. We have to put these items in a knapsack of weight **W** such that the **total value** obtained is **maximized**.

```
class Item:
```

```
    def __init__(self, value, weight):
```

```
        self.value = value
```

```
        self.weight = weight
```

```
def fractionalKnapsack( W, arr, n):
```

```
    arr.sort(key=lambda x: x.value / x.weight, reverse=True)
```

```
    curWeight = 0
```

```
    finalvalue = 0.0
```

```
    for i in range(n):
```

```
        if curWeight + arr[i].weight <= W:
```

```
            curWeight += arr[i].weight
```

```
            finalvalue += arr[i].value
```

```
        else:
```

```
            remain = W - curWeight
```

```
            finalvalue += arr[i].value / arr[i].weight * remain
```

```
            break
```

```
    return finalvalue
```

```
n = 3
```

```
W = 50
```

```
arr = [Item(60, 10), Item(100, 20), Item(120, 30)]
```

```
ans = fractionalKnapsack(W, arr, n)
```

```
print("The maximum value is", ans)
```

```
< 32 ans = fractionalKnapsack(W, arr, n)
33 print("The maximum value is", ans)
```

input

The maximum value is 240.0
